

Integration as Standard

The PerceptiveAPC system collects data from your system and writes out control setpoints, either directly to PLC or via your SCADA. To help achieve this, the software suite is provided with both OPC client and server interfacing, enabling reliable exchange of process data with other applications conforming to the OPC DA (Data Access) standard. Alternatively, we will adopt the protocol preferred by the client, such as ODBC.

The PerceptiveAPC Suite is capable of generating real-time reports for Key Performance Indicators, using validated, trustworthy data. These can be made available via remote web pages, for access by operators, supervisors and managers.

Perceptive's software runs on a Windows™ platform, either on a dedicated PC or a virtual machine within your server. The interface configuration and testing is performed by a professional System Integrator, to ensure 'bumpless' switching between your existing control and APC, and vice-versa, and to ensure that nothing can be read in or written out that would upset your process.
